We claim:

1. An article, comprising:

a substrate having at least one surface; and
a photo-induced hydrophilic coating deposited over
at least a portion of the at least one surface, wherein an
outer surface of the photo-induced hydrophilic coating has a
root mean square roughness of less than or equal to 2 nm; and
wherein the photo-induced hydrophilic coating is
deposited by a process selected from chemical vapor
deposition, magnetron sputtered vacuum deposition, and spray
pyrolysis.

- 2. The article as claimed in claim 1, wherein a contact angle of a water droplet on the article is less than 15° after exposure of the coating to UVA340 radiation at 24 W/m² for 60 mins.
- 3. The article as claimed in claim 1, wherein a contact angle of a water droplet on the article is less than 10° after exposure of the coating to UVA340 radiation at 24 W/m² for 60 mins.
- 4. The article as claimed in claim 1, wherein a contact angle of a water droplet on the article is less than 5° after exposure of the coating to UVA340 radiation at 24 W/m^2 for 60 mins.
- 5. The article as claimed in claim 1, wherein the contact angle of a water droplet on the article is less than or equal to 1%.
- The article as claimed in claim 1, wherein the photo-induced hydrophilic coating has a thickness of less than or equal to 500 Å.

HUN

- 8. The article as claimed in claim 1, wherein the photo-induced hydrophilic coating has a thickness of less than or equal to 300 $\hbox{\AA}$.
- 9. The article as claimed in claim 1, wherein the photo-induced hydrophilic coating has a thickness of less than or equal to 200Å.
- 10. The article as claimed in claim 1, wherein the photo-induced hydrophilic coating has a thickness in the range of 50 Å to 500 Å.
- 11. The article as claimed in claim 1, wherein the photo-induced hydrophilic coating includes at least one metal oxide and/or metal alloy oxide selected from titanium oxides, silicon oxides aluminum oxides, iron oxides, silver oxides, copper oxides tungsten oxides, zinc/tin alloy oxides, zinc stannates, molybdenum oxides, zinc oxides, strontium titanate, cobalt oxides, chromium oxides, and mixtures or combinations thereof.
- 12. The article as claimed in claim 1, wherein the photo-induced hydrophilic coating comprises titanium dioxide.
- 13. The article as claimed in claim 12, wherein the titanium dioxide is selected from the group consisting of anatase, rutile, brookite, amorphous, and mixtures or combinations thereof.
- 14. The article as claimed in claim 1, wherein the photo-induced hydrophilic coating is substantially non-porous /

- 15. The article as claimed in claim 1, wherein the outer surface of the coating has a root mean square roughness of less than or equal to 1 nm.
- 16. The article as claimed in claim 1, wherein the outer surface of the coating has a root mean square roughness in the range of 0.2 pm to 0.7 nm.
- 17. The article as claimed in claim 1, wherein the coating has a photocatalytic activity of less than or equal to 5×10^{-3} cm⁻¹ min⁻¹.
- 18. The article as claimed in claim 1, wherein the coating has a photocatalytic activity of less than or equal to 3×10^{-3} cm⁻¹ min⁻¹.
- 19. The article as claimed in claim 1, wherein the coating has a photocatalytic activity of less than or equal to 2×10^{-3} cm⁻¹ min⁻¹ $\pm 2 \times 10^{-3}$ cm⁻¹ min⁻¹.
- 20. The article as claimed in claim 1, wherein the article has a visible light reflectance in the range of 15% to 25%.
- 21. The article as claimed in claim 1, including at least one additional coating located between the photo-induced hydrophilic coating and the substrate.
- 22. The article as claimed in claim 21, wherein the additional coating is a functional coating selected from the group consisting of a sodium ion diffusion barrier, a solar control coating, and an antireflective coating.
- 23. The article as claimed in claim 1, wherein the substrate includes a first surface and a second surface, with the coating deposited over at least a portion of the

first surface and with the second surface having tin diffused therein.

- 24. The article as claimed in claim 1, wherein the substrate is a float glass ribbon and the process is selected from chemical vapor deposition and spray pyrolysis.
- 25. The article as claimed in claim 24, wherein the float glass ribbon is located in a molten metal bath and the process is chemical vapor deposition.
- 26. The article as claimed in claim 1, wherein the article is a monolithic or laminated window unit having an inner surface and an outer surface with the photo-induced hydrophilic coating deposited on the outer surface.
- 27. The article as claimed in claim 1, wherein the article is an insulating glass unit having number 1, 2, 3, and 4 surfaces and the photo-induced hydrophilic coating is located on at least one of the number 1 or number 4 surfaces.
- 2/8. The article as claimed in claim 27, including a functional coating located on at least one of the number 2, number 3, or number 4 surfaces.
- 29. The article as claimed in claim 1, wherein the article is an automotive transparency.
- 30. The article as claimed in claim 1, wherein the article is an architectural window.
- 31. The article as claimed in claim 1, wherein the article is an automotive transparency having an inner surface and the coating is deposited on the inner surface.

- 32. The article as claimed in claim 1, wherein the coating comprises titanium dioxide having a thickness in the range of 200 Å to 300 Å, a root mean square smoothness of less than or equal to 1 nm, and a photocaralytic activity of less than or equal to 3 x 10^{-3} cm⁻¹ min⁻¹.
- 33. The article as claimed in claim 1, wherein the substrate includes a functional coating deposited over at least a portion of the substrate.
- 34. The article as claimed in claim 33, wherein the functional coating is a solar control coating.
- 35. The article as claimed in claim 1, wherein the substrate includes a first surface and a second surface, with the photo-induced hydrophilic coating deposited over at least a portion of the first surface and with a functional coating deposited over at least a portion of the second surface.
 - 36. / An article, comprising:
 - a float glass ribbon having at least one surface;

and

a/photo-induced hydrophilic coating deposited directly on at least a portion of the at least one surface, wherein the photo-induced hydrophilic coating is deposited directly on the float glass ribbon in a molten metal bath.

37. An article, comprising:

a substrate having at least one surface; and a photo-induced hydrophilic coating deposited over at least a portion of the at least one surface,

wherein the photo-induced hydrophilic coating has a photocatalytic activity of less than or equal to 3×10^{-3} cm⁻¹ min⁻¹.

38. An article, comprising:

a substrate having at least one surface;
a photo-induced hydrophilic coating deposited over
at least a portion of the at least one surface,

wherein the substrate is a float glass ribbon located in a molten metal bath,

wherein the photo-induced hydrophilic coating has a thickness of 500 Å or less, and

wherein the photo-induced hydrophilic coating is deposited over the at least one surface in a molten metal bath by chemical vapor deposition.

39. An article, comprising:

a substrate having at least one surface; and a photo-induced hydrophilic coating deposited over at least a portion of the at least one surface,

wherein the photo-induced hydrophilic coating is deposited by chemical vapor deposition at a temperature in the range of 500°C to 1200°C, and wherein the photo-induced hydrophilic coating has a thickness of 500 Å or less.

40. A method of forming a photo-induced hydrophilic coating over at least a portion of a substrate, comprising the steps of:

providing a substrate having a first surface and a second surface, with at least one of the surfaces having tin diffused therein:

depositing a metal oxide precursor from a coating device onto at least one of the surfaces by a process selected from chemical vapor deposition, spray pyrolysis, and magnetron sputtered vacuum deposition; and

heating the substrate to a temperature sufficient to decompose the metal oxide precursor to form the photo-induced hydrophilic coating having a root mean square roughness of 2 nm or less.

41. The method as claimed in claim 40, wherein the coating device is a chemical vapor deposition coater, and

the metal oxide precursor is selected from titanium tetrachloride, titanium tetraisopropoxide, titanium tetraethoxide, titanium tetrabutoxide, and mixtures thereof.

- 42. The method as claimed in claim 40, wherein the photo-induced hydrophilic coating comprises titanium dioxide.
- 43. The method as claimed in claim 40, wherein the photo-induced hydrophilic coating has a thickness such that a contact angle of a water droplet on the coated substrate is less than 15° after exposure of the coating to UV radiation of 340 nm at an intensity of 24 W/m^2 for 60 mins.
- 44. The method as claimed in claim 40, wherein the photo-induced hydrophilic coating has a thickness of less than or equal to 300~Å.
- 45. The method as claimed in claim 40, wherein the photo-induced hydrophilic hydrophilic coating has a thickness of 50Å to 250Å.
- 46. The method as claimed in claim 40, wherein the coating device is a pyrolytic coater and the method includes directing a suspension of the metal oxide precursor from the pyrolytic coater onto the first surface.
- 47. The method as claimed in claim 40, wherein the metal oxide precursor is deposited directly onto the surface of the substrate.
- 48. The method as claimed in claim 40, wherein the coating has a photocatalytic activity of less than or equal to $3 \times 10^{-3} \text{ cm}^{-1} \text{ min}^{-1}$.
- 49. The method as claimed in claim 40, wherein the coating has a thickness in the range of 200 Å to 300 Å, a

root mean square roughness of 0.2 nm to 1.5 nm, and a photocatalytic activity of less than or equal to 3 x 10^{-3} cm⁻¹ min⁻¹.

50. A method of forming a photo-induced hydrophilic coating over at least a portion of a substrate, comprising the steps of:

providing a float glass ribbon in a molten metal
bath;

depositing a metal oxide precursor material from a coating device directly onto a top surface of the glass ribbon by chemical vapor deposition; and

heating the glass ribbon to a temperature sufficient to decompose the metal oxide precursor material to form the photo-induced hydrophilic coating.

- 51. The method according to claim 50, including depositing the metal oxide precursor material to provide a photo-induced hydrophilic coating having a thickness of 500 $\rm \AA$ or less.
- 52. A method of forming a photo-induced hydrophilic coating over at least a portion of a substrate, comprising the steps of:

providing a substrate having at least one surface; depositing a metal oxide precursor material from a CVD coating device over at least a portion of the at least one surface;

heating the substrate to a temperature in the range of 400°C to 1200°C to decompose the metal oxide precursor material to form the photo-induced hydrophilic coating; and

providing sufficient precursor material such that the photo-induced hydrophilic coating has a thickness of 500 Å or less.

53. A product formed by the process of claim 40.
